The Life of Sir William Osler, Volume 1 May 26 2022 William Osler (1849-1919) is widely regarded as one of the most influential physicians of the late 19th and early 20th century and a key figure in the history of medicine. Besides his research activities and his dedicated scientific work, Osler's greatest contribution to the medical world has been the system of residency which he developed at the Johns Hopkins Hospital in Baltimore, thus introducing a new and deeply humanistic approach to the strictly scientific realm of traditional medicine. Harvey Cushing (1869-1939), a former student and close friend of Osler's and a pioneer of neurosurgery, has himself become an icon of modern medicine. He was one of the first physicians to use X-rays for diagnosing brain tumours and he developed revolutionary methods of blood pressure measurement. He also discovered Cushing's syndrome, the first autoimmune disease identified in a human being. This monumental biography earned him the Pulitzer Prize in 1926.

*History of Ophthalmology* Oct 31 2022 When the eyeball is indented in total darkness, within less than 200 milliseconds an oval or quarter-moon shaped spot of light is perceived in the part of the visual field corresponding to the indented region of the retina. In the seconds following, this phosphene extends across the whole visual field and alters in structure during further eyeball indentation. It is then seen as irregular large bright spots of light, finely structured moving light grains ('light nebula') and stationary bright stars. Regular geometrical patterns appear only when both eyes are indented simultaneously [1]. When the eyeball deformation is released, part of the retina again lights up for another one or two seconds and curved light lines are seen following the course of the larger retinal vessels (Fig. 1). In the following we will review the history of this phenomenon, which played an important role during the first 2200 years of vision theories and in the development of models to explain normal vision. 2. Pre-Socratic philosophers, Plato and Aristotle Alcmaeon of Croton (6-5th century B. C. ), who was a member of the Pythagorean sect and one of the founders of Greek medicine, was the first to describe mechanical deformation of the eyeball leading to light sensations. According to Aristotle's pupil Theophrastus of Eresos, Alcmaeon reported that 'the eye obviously has fire within, for when the eye is struck fire flashes out' [2, p. 88].

**The General** Mar 31 2020 Officially founded in 1819, the Montreal General Hospital is recognized as a pioneering institution in North America for the many discoveries in medical research made there and for its early association with the Faculty of Medicine at McGill University - the first medical school in Canada. Covering nearly 200 years of history, The General relates the story of the hospital from its origins and founding to the transition and aftermath of its incorporation into the McGill University Health Centre in 1997. With contributions that show the perspectives of clinicians, nurses, surgeons, professors, and administrators, chapters chronicle the history of particular departments and specializations of the hospital, including cardiology, dermatology, endocrinology, neurosurgery, plastic surgery, obstetrics, emergency medicine, pathology, and radiology, as well as nursing, administration, and governance. Among the major turning points in the history of the hospital were the introduction of autopsy pathology by Sir William Osler, the debut of the electrocardiograph by Thomas Cotton in 1914, the discovery of a malignant tumour marker by Phil Gold and Samuel Freedman in 1965, its transformation from a community hospital serving anglophone Montreal to an internationally recognized academic centre during the 1950s and '60s, and changes in governance due to the 1970 Quebec Medicare Act. Both a collective reminiscence and an extensive institutional history, The General is an engaging account of one prominent hospital's development over nearly 200 years.

**McGill Medicine** Sep 17 2021 This second volume in the history of the McGill University Medical School begins a few years before the opening of the Royal Victoria Hospital in 1894 and traces the major developments in the institution's second half century. At the beginning of this period the McGill Faculty of Medicine was already ranked as among the best in North America, but its reputation had declined by World War I. During the next twenty years major reforms created new research laboratories, expanded library facilities, and continued modernization of the Royal Victoria Hospital. The Montreal Neurological Institute was opened, a children's hospital was established, and the Montreal General Hospital was expanded. McGill Medicine is also the story of the doctors and administrators who made all this happen: visionaries such as Principal Sir Arthur Currie and Dr C.F. Martin, who shepherded the concept of full-time faculty through the various approval processes of the school; Dr J.C. Meakins, who became, in 1924, the first full-time professor of medicine; and Dr Wilder Penfield, the founder and first director of the Montreal Neurological Institute. The book ends just before WWII, by which time McGill again held an enviable place among the world's medical teaching institutions.

**Women in Ophthalmology** Sep 29 2022 There are nearly 24,000 ophthalmologists in the United States, with 500 physicians newly entering the ophthalmology field each year and approximately half of those being women. Although women now represent approximately half of all ophthalmologists, gender disparities remain when it comes to certain subspecialties (e.g., surgical retina), leadership roles (e.g., department chairs), industry involvement (e.g., consultancy and advisory board positions), and even academic publications. There has been a recently heightened interest in female representation in this field which has manifested in several ways (e.g.,

conferences geared towards women in ophthalmology, non-peer-reviewed publications about women in ophthalmology, and mentorship programs specifically for women). This book is the first of its kind in procuring and disseminating information—pertaining to both career and life—in an organized, concrete, and enduring way. *Women in Ophthalmology* is a comprehensive collection of chapters primarily written by women in the field of ophthalmology. The book aims to guide others through milestones and challenges women may face during their careers, and shares sound insights into how to deal with unique issues both inside and outside the workplace. Topics that are widely applicable to all who work in ophthalmology are included, such as finding mentors, collaborating within industry, handling work-life balance, and seeking out leadership opportunities. Each chapter combines personal anecdotes with knowledge from leaders in the field which both men and women will find highly valuable.

*Neuro-vascular Neuro-ophthalmology* Sep 05 2020 Neuro-ophthalmological symptoms frequently arise in disorders which alter the intracranial and intraorbital circulation. Because of the wide range of sensory and cognitive systems involved in vision and eye movements, visual disturbances are typically found in the common vascular disorders, such as atherosclerosis, migraine, and aneurysms, but can also result from practically any, common or rare, local or systemic vascular disorder. The dysfunction can be part of a larger syndrome or the predominant clinical abnormality. Many of the newer concepts concerning the diagnosis and treatment of neurovascular disorders have evolved in consequence of advances in techniques for neuroimaging such as MRI; methods of measuring systemic coagulation and inflammation; and superselective catheterization of abnormal blood vessels and vascular lesions. The neuroophthalmological evaluation of clinical signs and symptoms often leads to accurate localization and diagnosis of the lesion. Many of these clinical abnormalities, such as visual field defects and ocular misalignments, can be quantified and followed to assess either the natural history of the disorder or the effects of therapies. No one medical specialty can manage these neurovascular neuro-ophthalmological disorders alone. The complexity of diagnosis and treatment planning requires a multi-disciplinary team. This approach, bringing ophthalmologists, neurosurgeons, and neurologists together to confer in the management of these cases, has been pioneered by the authors' group at the New York University Medical Center.

William Osler Aug 29 2022 In his time the most famous physician in the world, Canadian-born William Osler (1849-1919) is still the best-known figure in the history of medicine. This new, definitive biography by Michael Bliss is the first full-scale life of Osler to appear since 1925. An award-winning medical historian, Bliss draws on many untapped sources to recreate Osler's life and medical times for a new generation of readers. Born at Bond Head, north of Toronto, Osler rose from obscurity to become the greatest medical teacher and writer in three countries. At Canada's McGill University, America's Johns Hopkins University, and finally as regius professor at Oxford, Osler was idolized by two generations of medical students and practitioners, for whom he came to personify the ideal doctor. His quest was to bring high standards and scientific methods into general practice in the medical world and to give teaching hospitals a solid place in the education of doctors. The publication of his book, *The Principles and Practice of Medicine* (1892), established him as the authority of modern medicine, a position he held well into the new century. Osler was revered as the high priest of the advent of twentieth-century medicine. In this fine biography, Michael Bliss animates the epic quality of Osler's life - not only in telling his personal story, but in setting that story against the dramatic backdrop of the coming of modern medicine. Winner of the Jason A. Hannah Medal, awarded by the Royal Society of Canada and the Hannah Institute for the History of Medicine
