Depression and epilepsy: A bidirectional relationship and perspective on current thinking with future recommendations Oct 04 2022 Research Paper (undergraduate) from the year 2012 in the subject Psychology - Clinic and Health Psychology, Abnormal Psychology, grade: 1st, Royal Holloway, University of London (Department of Psychology), course: psychology, language: English, abstract: Depression is common in epilepsy, but few studies investigate this relationship (Lambert et al, 1999). The purpose of this paper is first to examine the reasons behind the failure to diagnose and treat depressive disorders in epilepsy, and second to identify a clinical and research agenda that will advance understanding of the nature of this comorbid illness. This paper uses literature identified through a non-systematic search in PubMed and the authors own clinical experience with this patient group. Findings indicate epilepsy and depression exist as a co-morbid illness, with the prevalence of depression being almost twice as common in people with epilepsy compared to the general population. Alongside this, episodic seizures and a diagnosis of epilepsy are more common in individuals diagnosed with a depressive disorder than among those undiagnosed. In many of these patients depression affects their quality of life more severely than the seizures themselves, as indicated by increased suicide rates in this population group. Diagnosing depression in epilepsy may be difficult because the symptoms are somewhat atypical and appear episodically. Depressive symptoms may be temporarily related to seizures (ictal or peri-ictal) or more often, independent of seizures (interictal). This phenomenon may be explained by evidence of pathophysiological mechanisms common to both disorders. Antidepressants can, in some cases,

reduce the seizure threshold, but SSRI ' s do this to a little or negligible extent. Therefore these drugs are recommended as a first line of treatment for depression in people with epilepsy. Overall depression is not found to be simply a reactive process to epilepsy. There appears to be a bidirectional relationship between epilepsy and depression, as both conditions increase the risk of developing the other. Recommendations for future practice are suggested. Implications for future research include the need to investigate treatment modalities with the same scientific rigor used in any neuropsychiatric disorder and its control.

The Great Depression Jan 03 2020 Seminar paper from the year 2018 in the subject Business economics - Economic and Social History, grade: 1.5, , language: English, abstract: This research paper will provide a comprehensive overview of the causes of the Great Depression and explain why it lasted for so long. The Great Depression of 1929 was one of the most remarkable economic challenges in the United States of America that were experienced throughout the early 20th century. The effects of the Great Depression of 1929 were not felt in the United States of America alone, but also in the whole world. Before, the start of this economic crisis in 1929, economy of the United States of America had flourished increasingly to reach a stable status owing to the extensive international trade links that the U.S had established with overseas countries. Economists cite some economic problems in the economy of the U.S to be the principal causes of the Great Depression. Some of these causes include the World War I, the U.S economic policies and the operations of the Federal Reserve System.

Money, Sticky Wages, and the Great Depression Mar 05 2020 Abstract: This paper examines the ability of a simple stylized general equilibrium model that incorporates nominal wage rigidity to explain the magnitude and persistence of the Great Depression in the United States. The impulses to our analysis are money supply shocks. The Taylor contracts model is surprisingly successful in accounting for the behavior of major macroaggregates and real wages during the downturn phase of the Depression, i.e., from 1929:3 through mid-1933. Our analysis provides support for the hypothesis that a monetary contraction operating through a sticky wage channel played a significant role in accounting for the downturn, and also provides an interesting refinement to this explanation. In particular, both the absolute severity of the Depression's downturn and its relative severity compared to the 1920-21 recession are likely attributable to the price decline having a much larger unanticipated component during the Depression, as well as less flexible wage-setting practices during this latter period. Another finding casts doubt on explanations for the 1933-36 recovery that rely heavily on the substantial remonetization that began in 1933.

Trends in Depression Research May 31 2022 The global community is negatively impacted on a large-scale with tens of millions of people world-wide suffering from major depression. Economic growth is being stunted and lifestyles and lives crippled. Unfortunately, it is not clear what the myriads of causative factors are. Depression Research in Nursing Sep 10 2020 Depression has become a major international health issue and should be a concern of every nurse, regardless of specialty. While physicians are focused on etiology and medical treatment, nurses must attend to how people express and deal with this crippling illness. This volume provides new knowledge about depression that can be translated into clinical care on both the individual and community level. The book sheds light on this debilitating chronic disorder and will help guide the understanding and approach to a person with depression. While there is evidence that depression is manifested differently by characteristics such as gender, race, and culture, we know very little about the mechanisms, both biological and socio-cultural, that create or contribute to these differences. The research included maintains an international perspective with a broad focus on special populations and multicultural groups. Included are findings from studies on: Depression in individuals with intellectual and developmental disabilities Maternal postpartum depression Older adults with depression Stress and depression after traumatic brain injury The impact of war stress on the health of Lebanese families

Music Therapy vs. Antidepressants for Teens with Depression Nov 05 2022 Research Paper (undergraduate) from the year 2018 in the subject Psychology - Consulting, Therapy, grade: 1,0, , language: English, abstract: This research evaluated the advantages and disadvantages of two types of treatment for depression in teens, music therapy and antidepressant drugs. The purpose of evaluating these two treatments is to decipher which is ultimately the best treatment, according to studies, articles, and documentaries. It is important to note that while this research has analyzed data in order to understand what the best treatment is, there is no single treatment that will work for every patient. This research is important for teens coping with depression, as it indicates that there are many ways to treat depression. It is also important that teens not feel alienated with their mental illness, therefore more research should be targeted towards adolescents dealing with mental health problems. The method used for this research was a content analysis, as it effectively organized the data and quantified studies, articles, and other forms of data. Eight thematic concepts have been recognized, and then turned into questions that were answered using a 4 Point Scale. This 4 Point Scale evaluated strong and weak advantages/disadvantages, based on data provided, for each thematic concept. According to the 4 Point Scale, music therapy received 28 out of a possible 32 points, meanwhile antidepressant drugs received 16 out of 32 points. These findings state that in ratio terms, music therapy received an overall better score than antidepressants. In terms of thematic concepts, music therapy gained points in categories regarding emotional support and a less invasive technique style, whereas antidepressant drugs received points in areas regarding long term relief and the positive effects of chemically balancing the brain.

New Research in Obsessive-Compulsive Disorder and Major Depression Jul 01 2022 Major depression and obsessive-compulsive disorder (OCD) are now recognized among the most frequent psychiatric disorders, affecting 16–17% and 2–3% of the general population, respectively. They are commonly characterized by: i) a high level of psychiatric and somatic comorbidities; ii) a recurrence or chronic profile; and iii) a negative impact on daily functions, thereby leading to a profound impairment of quality of life. Despite significant advances in pharmacological and psychological therapies over the last decades, unsuccessful responses to standard treatment strategies are classically observed in approximately 20–30% of cases. Therefore, there is a significant need for improving the pathophysiological knowledge through a better identification of environmental, clinical, psychological, genetic, anatomical, and biological determinants, specifically implied in the development, the phenotypic expression, and the relapsing course and/or contributing to the therapeutic failure in major depression and OCD. We are convinced that this research approach is particularly relevant providing critical support for the promotion of innovative treatment alternatives potentially useful for the management of resistant forms of major depression and OCD.

Understanding Depression, 2d ed. Jan 15 2021 Since the publication of the first edition in 1993, there have been important developments in the understanding of depression and in the treatment approaches. This new edition reflects these new realities, giving increased emphasis to the biological foundations of depression, the development of and wide use of antidepressant drugs, the shift in the means of dispensing these drugs from mental health professionals to primary care physicians, and the development of alternative medicine approaches to treatment. Written in an easy-to-read manner, the book provides a wide-ranging picture of what is known about depressed moods and depression, from demographic, biological, and psychological aspects to methods of treatment and issues surrounding recurrence.

Forming Influence: Collected Papers from the 2016 John Wesley Honors College Research Tutorial Jun 19 2021

The essays in this volume are the culmination of a semester 's work exploring and analyzing the forms through which we influence others and are in turn influenced by those others, conceptualized in the broadest sense, including the human, the non-human, the divine, and various social and biological forces. Written by students from a variety of disciplinary backgrounds, these essays come out of a research tutorial course at the John Wesley Honors College, Indiana Wesleyan University in which we together explored these ever-present but seldom-recognized influences.

International contributors, with backgrounds in psychiatry, psychology, medicine, nursing, midwifery, and social work, discuss the advantages and drawbacks of the available screening methods, and investigate women's perceptions of the usefulness of screening. Ethnic minority experiences and screening programs in developing countries are also considered.' - Book News 'The book considers a variety of issues and identifies agreement in ideas and continuing debates. Whether the reader is concerned with women's views of screening, the role of the midwife, screening in the US, Australia or developing countries, screening of women with serious mental illness, Black Caribbean women's views of screening, health visitor intuition and much more, there is something here for them. Each chapter, often drawing on the author's own work, stands on its own. Tutors, researchers, practitioners and students should be able to use the relevant parts to challenge their thinking,

reflect on their practice and ask yet more questions about this significant subject.' - Community Practitioner Screening for perinatal depression is now widely undertaken in the UK and Europe and is attracting increasing attention. This much-needed text provides guidance for health care professionals on the issues and controversies surrounding screening and on good practice in the use of screening tests. An international author team with backgrounds in psychiatry, psychology, medicine and nursing has been brought together to discuss the available screening methods, their advantages and drawbacks. The authors investigate women's perceptions of the accessibility and usefulness of screening and of the roles of professionals (e.g. primary care staff and health visitors), and also look at ethnic minority women's experiences of health services. The role of the UK National Screening Committee is explored, along with the problems faced when implementing screening programmes in developing countries. This comprehensive and practical book will enable mental health professionals, social workers and health visitors to provide sensitive and informed services to women at risk of perinatal depression.

The Authenticity of Simulated Patients in Psychotherapy Training and Research Mar 17 2021 Mental health problems are highly prevalent worldwide. Fortunately, psychotherapy has proven highly effective in the treatment of a number of mental health issues, such as depression and anxiety disorders. In contrast, psychotherapy training as is practised currently cannot be considered evidence-based. Thus, there is much room for improvement. The integration of simulated patients (SPs) into psychotherapy training and research is on the rise. SPs originate from the medical education and have, in a number of studies, been demonstrated to contribute to effective learning environments. Nevertheless, there has been voiced criticism regarding the authenticity of SP portrayals, but few studies have examined this to date. Based on these considerations, this dissertation explores SPs' authenticity while portraying a mental disorder, depression. Altogether, the present cumulative dissertation consists of three empirical papers. At the time of printing, Paper I and Paper III have been accepted for publication, and Paper II is under review ...

The Model of Social Network Helpers. The Processes and Success of Catering Support to Suicidal Victims and Depression Victims Through Social Network Mar 29 2022 Research Paper (undergraduate) from the year 2015 in the subject Social Pedagogy / Social Work, , language: English, abstract: The successes of social networks in suicide prevention are seen in various facebook support groups that catered USA citizens. The success is based on the observation of researcher in those support group pages. It is beneficial as lives matter and we only live once in this world. The researcher would like to know how the research helped creating a move forward attitude of members with suicidal thoughts members or depression. The researcher would also like to know the success-rate of these support groups helps those who have suicidal thoughts or depression. The author of this paper is not a native English speaker. The Measurement of Social Skills in Depression Dec 02 2019 Seminar paper from the year 2005 in the subject Psychology - Clinic and Health Psychology, Abnormal Psychology, grade: A - (excellent), Indiana University (Psychology), course: Mood disorders, 24 entries in the bibliography, language: English, abstract: INTRODUCTION There has been a lot of research concerning the problem of social skill deficits in depression. Social skill deficits are assumed to be an important factor in contributing to the development as well as the maintenance of depression. Conceptually, authors deal with the construct "social skill" quite differently. They use a wide range of self-report and observer-rating scales, assessing different traits and abilities, behavioral tendencies and self-perceptions. The purpose of this paper is to present a comparison of those different assessment strategies used by researchers and to critically discuss their effectiveness and applicability as well as their validity and limitations. First, a short overview is given on the concept of social skills in depression to provide a framework. I will then present and discuss different operationalizations of social skills and compare measurements and basic findings to present and suggest useful components for future investigations. I will hereby concentrate on self-report and observer-rating assessment techniques. Finally, a summary and conclusion is given.

Landmark Papers in Psychiatry Feb 13 2021 Advances in the practice of psychiatry have occurred in "fits and starts" over the last several decades. These advances are evident to anyone long affiliated with the field and are best appreciated through direct experience of living through the times. These advances can also be gleaned from historical overviews in textbooks or the recollections of one's teachers and mentors. Returning to the original papers that have ushered in these changes is rarely done for various, mostly practical, reasons. Filtering

through thousands of articles in psychiatry may prove daunting, access to the manuscripts may be limited (especially for papers not available electronically), and understanding their impact requires a broader context. Moreover, with so much active research currently occurring in various branches of psychiatry, current practitioners or trainees may find their attention focused on the present, and this is reinforced by electronic search algorithms, which return articles in reverse chronological order. Not surprisingly, citations for articles in virtually all fields decline precipitously for articles over five years old. As scholars and professionals, we are losing touch with our academic heritage. Yet navigating the future of psychiatry requires a firm understanding of its past. This resource serves as a guide for anyone seeking to understand the evolution of psychiatry as a scientific discipline. It does so by summarizing over 100 landmark papers in psychiatry and placing their scientific contributions within a historical context. An introductory section sets the stage for the major theoretical constructs within the field, with chapters devoted to ontology and nosology. Subsequent sections examine major facets of the theory and practice of psychiatry, such as pathogenesis of psychiatric illness, pharmacotherapy, psychotherapy, and somatic treatments. These sections are divided logically into chapters addressing important contributions to the understanding and treatment of specific disorders. A final section explores ethical considerations within each field. This framework echoes the complexity of psychiatry, which cannot be reduced to a single set of diagnoses or subspecialty categories. Highlighting the research trajectory of psychiatry, this resource will appeal to academics, trainees, and practitioners who desire a comprehensive, easy-to-read, up-to-date collection of psychiatry's pivotal moments. By understanding the challenges, inspirations, and insights from the past, readers will be better poised to address new and ongoing challenges within the field.

Evidence-biased Antidepressant Prescription Aug 10 2020 This book addresses the over-prescribing of antidepressants in people with mostly mild and subthreshold depression. It outlines the steep increase in antidepressant prescription and critically examines the current scientific evidence on the efficacy and safety of antidepressants in depression. The book is not only concerned with the conflicting views as to whether antidepressants are useful or ineffective in various forms of depression, but also aims at detailing how flaws in the conduct and reporting of antidepressant trials have led to an overestimation of benefits and underestimation of harms. The transformation of the diagnostic concept of depression from a rare but serious disorder to an over-inclusive, highly prevalent but predominantly mild and self-limiting disorder is central to the book's argument. It maintains that biological reductionism in psychiatry and pharmaceutical marketing reframed depression as a brain disorder, corroborating the overemphasis on drug treatment in both research and practice. Finally, the author goes on to explore how pharmaceutical companies have distorted the scientific literature on the efficacy and safety of antidepressants and how patient advocacy groups, leading academics, and medical organisations with pervasive financial ties to the industry helped to promote systematically biased benefit-harm evaluations, affecting public attitudes towards antidepressants as well as medical education, training, and practice. Relationship between Suicidal Ideation, Depression and Self-Esteem among Physically Disabled Persons in Ghana Sep 03 2022 Research Paper (undergraduate) from the year 2016 in the subject Psychology - Clinic and Health Psychology, Abnormal Psychology, grade: A, University of Ghana, Legon, language: English, abstract: The study aimed at examining the relationship between self-esteem, depression and suicidal ideation among the physically disabled in Ghana. Purposive sampling was used to select one Hundred and Eighty (180). Specifically, sixty (60) participants who are visually impaired, sixty (60) who have hearing impairment and sixty (60) who have mobility impairment were selected for the study respectively. In view of this, two hypotheses were stated and tested using the statistical package for social sciences (SPSS). Hundred and eighty (180) questionnaires were distributed. A modified version Beck Depression Inventory (BDI) was used to test the depression level of the participant ' s level of depression. Suicidal ideation was measured by using Positive and Negative Suicidal Ideation (PANSI) with 14 items self-report instrument. The outcome of the study revealed that: 1. Self-esteem and depression related significantly with suicidal ideation. 2. Physical disability type had a significant influence on self-esteem and depression. 3. Mobility impaired had higher self-esteem than those who are visually impaired. 4. There was no significant difference between hearing impaired and visually impaired on depression. 5. There was no significant difference between mobility impaired and hearing impaired on suicidal ideation.

Implications of the Great Depression for the Development of the International Monetary System Jul 29 2019 In this paper we speculate about the evolution of the international monetary system in the last 2/3 of the 20th century absent the Great Depression but present the major post-Depression political and economic upheavals: WWII and II and the Cold War. We argue that without the Depression the gold-exchange standard of the 1920s would have persisted until the outbreak of WWI. It would have been suspended during the war and for a period of postwar reconstruction before being restored in the first half of the 1950s. The Bretton Woods Conference would not have taken place, and instead of a Bretton Woods System of pegged-but-adjustable exchange rates and restrictions on capital-account convertibility, an unreformed gold-exchange standard of pegged exchange rates and unlimited international capital mobility would have been restored. But this gold-exchange standard would have collapsed even earlier than actually was the case with Bretton Woods. The move toward floating exchange rates that followed would have taken place well before 1971 in our counterfactual. We construct a model of the international monetary system from 1928-1971 and simulate its implications for the determination of the world price level and the durability of the hypothetical gold-exchange standard. We then examine, based on regressions for a 61-country panel, the implications for economic growth and resource allocation of allowing 1920s-style international capital mobility after World War II. Based on the implications of our model simulations and the capital controls regression we contemplate the implications for institution building and international cooperation of the 'Great Depression' scenario.

Learning Lucid Dreaming and Its Effect on Depression in Undergraduates Apr 29 2022 "During each pre-semester season, Cornell students - flooded with papers, projects, and exams - can be found languishing in a pool of five-hour energy boosters and bitter coffee. The anxiety and depression that diffuse throughout the campus undeniably overwhelm the student body. When Isaac Taitz '11 began his research with Dr. Helene Porte of the Department of Psychology and Dr. Janis Whitlock of the Department of Human Development, he considered how creating an environment in which students felt more in control of their lives could alleviate the negative atmosphere that prevented many from developing a healthy mindset on campus. Ever since watching the inspirational film, *Waking Life*, Taitz explored the nature of dreams and consciousness and their applications to everyday life. Specifically, Taitz researched the effects of lucid dreaming on the mental health of college students. This has significant implications for the dreamers, who are aware of their dream state and able to mold their dreams to their liking. The students thus create a world in which only they can manipulate the outcomes of their dreams." - Sujin Lee, The Research Paper

Lykken and Aaron T. Beck to re-examine and reflect on their findings and engage in a lively discussion of the subsequent work that they have inspired. Revisiting the Classic Studies is a series of texts that introduces readers to the studies in psychology that changed the way we think about core topics in the discipline today. It provokes students to ask more interesting and challenging questions about the field by encouraging a deeper level of engagement, both with the details of the studies themselves and with the nature of their contribution. Written by researchers at the cutting edge of these developments, the chapters in each text provide details of the original works, as well as their theoretical and empirical impact.

Social Determinants of Health in Non-communicable Diseases Oct 31 2019 This book is open access under a CC BY-NC-ND 4.0 license. This open access book is the first compilation that reviews a wide range of social determinants of health (SDHs) for non-communicable diseases (NCDs) and healthy ageing in Japan. With the highest life expectancy and the largest elderly population in the world, Japan has witnessed health inequality by region and social class becoming more prevalent since the 2000s. The first half of this volume describes in detail major NCDs, such as cancers, heart and kidney diseases, diabetes, stroke, and metabolic syndrome. The second half, on the other hand, explores various SDHs relating to healthy ageing. All chapters review and focus on SDHs, particularly health inequality associated with socio-economic status and social capital, which are widely addressed in the field of social epidemiology. The book makes the argument that "Health for All" advocated by the WHO should be implemented based on social justice and benefits for the greater society.
