Mobility Aware Technologies and Applications

Jun 01 2020 The beginning of the twenty-first century is characterized by global markets, and the mobility of people is becoming an important fact of life. Consequently, the mobile user is demanding appropriate technical solutions to make use of customized information and communication services. In this context the notion of next-generation networks (NGNs), which are driven by the convergence of the entertainment sector, the mobile Internet, and fixed/mobile telecommunications, is emerging. Such NGNs are aggregating a variety of different access networks and supporting the seamless connection of an open set of end-user devices, and due to the adoption of an all-IP network paradigm they enable a much better integration of voice and data services. Coincidentally the buzzword 'fixed mobile convergence' (FMC) describes the current trend towards providing common services across fixed

and mobile networks resulting in the medium term in the full integration of fixed and mobile telecommunication networks. The adoption of appropriate middleware technologies and the provision of - called service delivery platforms driven by the ongoing innovation in the field of information technologies provides today the technical foundation for supporting terminal, personal and service mobility and thus the implementation of real seamless information and communication services. Furthermore, users are nowadays looking, in light of an omnipresent service environment, for a much higher degree of customization and context awareness in the services they use. The papers in this volume look at these enabling mobility-aware technologies and their use for implementing mobility-aware and context-aware applications.

Critique of Digitality Jul 14 2021 Dealing with digitality is one of the most urgent challenges of the present. The increasing importance and spread of computer technology not only challenges societies and individuals - this development also puts pressure on the concept of digitality, which tries to grasp the totality and peculiarity of the conditions and consequences of electronic digital computing (in all its forms). However, precisely because digitality is commonplace, so should be its critique, its analysis and assessment. How can an analysis do justice to both fundamental characteristics and changing concrete forms, infrastructures, and practices? How do the developments of a digitalization that programmatically encompasses forms of networking, embedding, and autonomization shape media, cultures, and societies? How do "artificial intelligence" and "algorithmic government" relate to each other, how does the immateriality of "the digital" fit with the materiality of computers? How does the changing status and scope of this technology mediate itself? This book introduces ongoing debates and develops its own approach to the critique of digitality, asking about forms of interfaces and processes of governance. This book is a translation of the original German 1st edition *Kritik der Digitalität* by Jan Distelmeyer,

published by Springer Fachmedien Wiesbaden GmbH, part of Springer Nature in 2021. The translation was done with the help of artificial intelligence (machine translation by the service DeepL.com). A subsequent human revision was done primarily in terms of content, so that the book will read stylistically differently from a conventional translation. Springer Nature works continuously to further the development of tools for the production of books and on the related technologies to support the authors.
