[Mercury Fate and Transport in the Global Atmosphere](#) Oct 19 2021 Mercury, primarily because of its existence and bioaccumulation as methylmercury in aquatic organisms, is a concern for the health of higher trophic level organisms, or to their consumers. This is the major factor driving current research in mercury globally and in environmental regulation, and is the driver for the current UNEP Global Partnership for Mercury Transport and Fate Research (UNEP F&T) initiative. The overall focus of the UNEP F&T report is to assess the relative importance of different processes/mechanisms affecting the transfer of mercury (Hg) from emission sources to aquatic and terrestrial receptors and provide possible source-receptor relationships. This transfer occurs through atmospheric transport, chemical transformations and subsequent deposition, and

involves the intermittent recycling between reservoirs that occurs prior to ultimate removal of Hg from the atmosphere. Understanding the sources, the global Hg transport and fate, and the impact of human activity on the biosphere, requires improved knowledge of Hg movement and transformation in the atmosphere. An improved understanding of Hg emission sources, fate and transport is important if there is to be a focused and concerted effort to set priorities and goals for Hg emission management and reduction at the national, regional and global levels; and to develop and implement such policies and strategies. To achieve this, a series of coordinated scientific endeavors focused on the estimation of sources, measurement and validation of concentrations and processes, and modeling, coupled with interpretation of the results within a policy framework, is likely to be required.

Start Your Engines Jun 02 2020 Start Your Engines: Developing Driving and Racing Games is a unique book that will teach readers everything they need to set up different types of road conditions, create opponents, set up road hazards, generate weather conditions, manage collisions, and much more. Not only will readers end up with the knowledge and tools they need to create driving and racing games, they get a full-featured, playable racing game that they can expand and customize with the skills learned in the book. The book shows readers how to develop live-action, interactive racing games with a unique three-tiered approach. Readers will start off by learning how to build a model for a racing game and then apply the physics to create a simple 2D (flat) game while learning how to create a variety of vehicles, race opponents, and terrain. In tier two, readers learn how to go from 2D to 3D with the same game concepts illustrating how to take the same basic idea for a game (and gameplay) and use modeling tips and tricks to begin customizing features. In the final tier, the author takes the concepts of 3D driving games to Mars with data modeled from real Mars terrain. Readers will create a dune buggy race on the planet of Mars and learn to create cool racing action at a bizarre and treacherous location.
